Bloomin' Acres

PROJECT STATUS REPORT

Prepared by OphidianAI

March 6, 2026

Version 1.0

Executive Summary

Full-stack e-commerce platform for a sourdough bakery and fresh produce business

Visual Design	9/10
Navigation	8/10
Account Mgmt	8/10
Mobile	7/10
User Journey	7/10
Checkout	6/10

Tech Stack

HTML/CSS/JS · Supabase · Stripe · Vercel · Supabase Auth · Supabase Storage · Stripe Checkout · Stripe Webhooks

Project Status

AREA	STATUS	NOTES
Landing Page	LIVE	CMS-driven content, dynamic hero/cards/hours/contact
Public Menu	LIVE	Stripe product sync, section editor, draft preview
Product Pages	LIVE	Variations, stock tracking, inline admin editor
Customer Accounts	LIVE	Cart, favorites, orders, profile, club dashboard
Bread Box Club	LIVE	Subscriptions, box builder, referral rewards
Admin Dashboard	LIVE	7 tabs: catalogue, menu editor, saved menus, landing, orders, analytics, club
Checkout Flow	BUG	Variation price delta not passed to Stripe -- see Priority Issues
SEO	MISSING	No meta descriptions, Open Graph tags, or structured data

Current Features

Complete inventory of implemented functionality across all pages

Customer-Facing Pages

Landing Page (index.html)

Hero with botanical SVG decorations, animated scroll elements. CMS-driven "Our Story" section, 3-card product showcase, 4-step "Seed to Table" process, hours/contact/map section. All content admin-editable via Supabase.

Public Menu (menu.html)

Branded menu card with dynamic sections and items synced from Stripe catalogue. Variation dropdowns, cart/favorites integration, draft preview mode for admins. Schedule availability banner.

Product Detail (product.html)

Product card with image, description, ingredients, variation selector (radio pills). Stock level indicators ("X left"). Add to cart and save/favorites with real-time Supabase updates. Skeleton loading states.

Bread Box Club (club.html)

Membership landing with benefits, how-it-works, and referral rewards. Stripe subscription checkout with referral code passthrough. Member/non-member state detection. Milestone rewards table.

Account Dashboard (account.html)

Authentication

Email/password sign-in and registration via Supabase Auth. Tab-based auth card with form validation and error display.

Shopping Cart

Item list with quantity controls, running total. Stripe hosted checkout with club discount (5% on $25+) and referral first-order discount (5%).

Favorites

Saved items grid with variation names, dynamic pricing, availability indicator ("Not on the Menu"). Quick add-to-cart action.

Orders

Order history with date, status badges (paid, fulfilled, picked up, cancelled), totals, and expanded line items.

Profile

First/last name, phone, email (read-only). Password change. Sign out.

Club Dashboard

Membership status, billing portal link, box builder with product search picker, referral share link, referral stats, progress bar, milestone chips.

Admin Dashboard (admin.html) -- 7 Tabs

Stripe Catalogue

Searchable product grid synced from Stripe. Links to inline product editor on product.html.

Menu Editor

Visual card editor with drag-and-drop sections and items. Draft preview, publish, and snapshot save. Schedule date range.

Saved Menus

Named menu snapshots with load and delete actions. Enables seasonal menu rotation.

Landing Page CMS

Image uploads, text editors for hero, story section, feature cards, hours, and contact info. Map auto-generation.

Orders Management

All-orders view with search and date/status filters. Status updates, order ticket printing with 5 label sizes and customizable detail levels.

Analytics

Period selector, KPI cards (revenue, orders, AOV, members), daily revenue chart, top products, order status breakdown, customer insights, club stats.

Club Management

Active members table, referral activity tracking, milestone reward text editor (updates club.html in real-time).

Backend & Integrations

Supabase, Stripe, and Vercel infrastructure

Supabase Database

TABLE	PURPOSE	RLS
profiles	User profile data (name, phone)	YES
admins	Admin role assignments	YES
menu_sections	Menu card section structure	YES
menu_items	Items within menu sections	YES
menu_schedule	Menu availability date range	YES
saved_menus	Named menu snapshots	YES
site_content	CMS key-value store for landing page	YES
product_details	Extended product info, variations JSONB	YES
user_cart	Per-user cart items with variations	YES
user_favorites	Saved/favorited products	YES
orders	Order records with status tracking	YES
order_items	Line items per order	YES
club_members	Subscription membership records	YES
referral_codes	Member referral codes	YES
referral_uses	Referral code usage tracking	YES
box_selections	Club box builder selections	YES

Stripe Integration

ENDPOINT	FUNCTION
/api/stripe/products	List active products with default prices

ENDPOINT	FUNCTION
/api/stripe/checkout	Create one-time payment session (club + referral discounts)
/api/stripe/subscribe	Create subscription checkout for club membership
/api/stripe/portal	Generate billing portal session for members
/api/stripe/webhook	Handle checkout.session.completed, subscription events, referral milestones

Supabase Storage Buckets

BUCKET	CONTENT
product-images	Product photos uploaded via admin editor on product.html
site-images	Landing page images (story photo, feature cards)

Priority Issues

Items that should be addressed before or shortly after launch

1. **Checkout variation pricing bug** CRITICAL
   account.html line 604: `variation_delta` and `variation_name` are not passed to `/api/stripe/checkout`. Customers with variation-priced items will be charged the base price only. Revenue leakage risk.

2. **Cart display missing variation names** CRITICAL
   `renderCart()` shows product name only. Customers cannot tell which variant is in their cart (e.g., "Sourdough" instead of "Sourdough -- Jalapeno Cheddar").

3. **API CORS headers too permissive** SECURITY
   `Access-Control-Allow-Origin: *` on checkout, subscribe, and config endpoints. Lock to production domain before launch.

4. **Missing SEO meta tags** SEO
   No `<meta name="description">`, Open Graph tags, or JSON-LD structured data on any page. Social shares and search results will show generic previews.

5. **Footer nav broken link** UX
   index.html footer has `href="#menu"` which doesn't exist on that page. Should link to menu.html.

6. **Social media placeholder links** CONTENT
   Instagram and Facebook icons link to #. Wire up to real social profiles or remove icons.

7. **Footer copyright year inconsistency** POLISH
   product.html and menu.html show "2025" while all other pages show "2026".

Optimization Suggestions

Performance, architecture, and UX improvements

Performance

Replace Tailwind CDN

Tailwind CDN loads ~350KB of CSS on every page. A purged production build would be under 20KB -- a 94% reduction in CSS payload.

HIGH IMPACT

Cache Stripe API Responses

The /api/stripe/products endpoint is called on 4 pages. Add a Cache-Control header (max-age=300) or use Vercel edge caching. The catalogue doesn't change per-request.

MEDIUM IMPACT

Image Optimization

Images in Supabase Storage are served at original upload resolution. Compress and constrain dimensions on upload, or use Supabase image transforms on the URL.

MEDIUM IMPACT

Static Asset Caching

Add Vercel cache-control headers for CSS, brand assets, and fonts. These rarely change and should be cached aggressively at the edge.

LOW IMPACT

Architecture

Shared Nav Component

Navigation HTML (~80-100 lines) and auth-init JS (~40 lines) are duplicated verbatim across 6 pages. Extract into a shared include or Web Component. Any nav change currently requires editing all pages.

MEDIUM IMPACT

Shared Utility Module

`showToast()`, `escHtml()`, and `formatPrice()` are duplicated in every page script. Extract into a shared utils.js loaded across pages.

LOW IMPACT

UX Improvements

Product Price Live Update

When a variation is selected on product.html, the displayed price does not update to reflect the variation delta. The base price stays static regardless of selection.

MEDIUM IMPACT

Loading Timeout Fallback

The account page loading overlay stays visible until init() completes. If the server is slow, customers see an indefinite spinner. Add a timeout fallback with a retry prompt.

LOW IMPACT

Suggested Features

Opportunities to enhance the platform and grow the business

E-Commerce & Ordering

- **Guest checkout** -- Remove the mandatory account creation barrier for first-time buyers. Highest impact for conversion rates.
- **Pickup time slot selection** -- Let customers choose a day/window at checkout. Critical for a farmstand with limited hours.
- **Order confirmation emails** -- Currently nothing is sent post-checkout beyond Stripe's default receipt. Add branded order confirmation and status update emails.
- **"Sold out" display** -- Show sold-out state on the menu when all variants of a product hit 0 quantity instead of silently hiding them.
- **Minimum order communication** -- The $25 club discount threshold is mentioned but not enforced or clearly communicated in the cart UI.

Customer Engagement

- **Email newsletter signup** -- Capture emails from visitors not ready to order. Simple form in the footer integrated with Resend or Mailchimp.
- **"Notify when back"** -- Let customers subscribe to out-of-stock product alerts for seasonal or limited items.
- **Customer reviews** -- Social proof on product pages would drive conversions. Even a simple testimonials section would add trust.
- **Seasonal availability notes** -- Label products with "Available June-September" tags to set expectations for produce items.

SEO & Discoverability

- **Meta descriptions** -- Add unique `<meta name="description">` to each page for search result snippets.
- **Open Graph tags** -- `og:title`, `og:description`, `og:image` for proper social media share previews.
- **JSON-LD structured data** -- LocalBusiness schema markup would help Google surface the business in local search results.
- **Dynamic page titles** -- Product pages should include the actual product name in `<title>`, not just "Product -- Bloomin' Acres".
- **sitemap.xml + robots.txt** -- Standard SEO hygiene for search engine indexing.

Admin & Operations

- **Order status notifications** -- Email customers when admin marks an order as fulfilled or ready for pickup.
- **Low inventory alerts** -- Notify admin when variation quantities drop below a threshold.
- **Bulk order export** -- CSV export of orders for accounting and fulfillment planning.
- **Weekly box compilation view** -- Consolidated view of all club box orders for the current week to streamline packing.
- **Menu scheduling automation** -- Auto-publish/unpublish saved menu snapshots on scheduled dates.

Content

- **Photo gallery** -- Showcase the farm, baking process, and seasonal produce to build trust and connection.
- **FAQ page** -- Pickup process, fermentation questions, membership details. Reduces support burden.
- **Blog / seasonal updates** -- Announcements for what's in season, new products, farm events.

Code Quality Assessment

HTML structure, CSS organization, JavaScript patterns, accessibility, and security

Strengths

- **Semantic HTML** -- Proper use of `<section>`, `<article>`, `<nav>`, `<header>`, `<footer>`, `<main>` throughout
- **CSS architecture** -- Well-organized design tokens via CSS custom properties in `:root`. Each page has a scoped stylesheet. Layered, color-tinted shadow system.
- **JavaScript encapsulation** -- IIFE pattern prevents global scope pollution. Consistent async/await with graceful error fallbacks.
- **XSS protection** -- `escHtml()` sanitization function applied before injecting user-visible data across all pages
- **Accessibility** -- ARIA attributes on nav, sidebar, dialogs, and icon buttons. Focus-visible styles. Decorative images properly hidden.
- **Parallel data fetching** -- `Promise.all()` used for concurrent API calls. Lazy-loaded club data on tab click.
- **Row Level Security** -- All 16 Supabase tables have RLS enabled. Admin writes protected server-side.
- **Mobile touch support** -- Drag-and-drop in variation manager handles both HTML5 drag events and touch events

Areas for Improvement

- **Code duplication** -- Nav HTML and auth-check JS copied verbatim across 6 pages. Utility functions duplicated in every script block.
- **No build pipeline** -- Raw HTML/CSS/JS with CDN dependencies. No minification, tree-shaking, or asset optimization.
- **Tailwind CDN** -- Full Tailwind loaded on every page (~350KB). Only a fraction of utility classes are actually used.
- **Missing skip-to-content link** -- No keyboard-accessible skip navigation link on any page.
- **CORS configuration** -- API endpoints use `Access-Control-Allow-Origin: *` instead of the production domain.
- **No sitemap or robots.txt** -- Missing basic SEO infrastructure files.

Security Posture

AREA	STATUS	NOTES
Authentication	GOOD	Supabase Auth handles session management, token refresh
Authorization	GOOD	RLS on all tables; admin checks server-side
XSS Prevention	GOOD	escHtml() applied consistently
CORS	NEEDS FIX	Wildcard origin on API endpoints
API Keys	GOOD	Only anon key exposed client-side (by design)

AREA	STATUS	NOTES
Payment Security	GOOD	Stripe hosted checkout; no card data touches the server
